Approach.

1. Importing the data in the MYSQL Workbench using the command prompt.

2. Writing queries and generating the features using Data Manipulation Language.

3. Creating views for each feature individually.

4. Mapping the views with the usersregistrationdata table using the left join command(mentioned in the code file).

5. Creating a table of the final view.

6. Exporting the table out of MYSQL workbench.

Data Pre-processing and Cleaning.

1. Found out the null values in the columns.
2. Identified whether continuous or categorical.
3. Updated them using the Update command of DDL.
4. Researched the requirements and fulfilments on google.
